EXAMPLE, fictional site

Site study: Fictional site

What each MW of this site earns per day in three paths, from the public model at github.com/Hoblayerta/mw-index, plus public filings where marked. Model output from public averages, not a forecast and not an offer.

20 MW	$50/MWh	27 J/TH	1.3
Site power	Power price	Fleet efficiency	PUE for AI load

Own cash per MW moved to AI: $1.76M to $2.41M before first rent (10-year loan at 10%). For 20 MW all to AI: $35.20M to $48.27M. Who has put up that cash instead, with public examples: the tenant, as a jv partner, a gpu host's capital arm, convertible-note investors, the operator's own bitcoin. **Missing:** No source shows anyone putting up the 20% for a 5 to 50 MW site without a signed tenant, or a tenant prepaying rent to fund the build.

THREE PATHS, USD PER DAY

Path and basis	Per MW	Whole site	Capex per grid MW	Capex, whole site	Simple payback
Keep mining	**$257**	**$5,133**	$0.85M to build a mine (model reference), already spent on an existing site. Fleet refresh: **Not in model: ASIC price per TH**	$17.00M (reference)	**Not found: needs ASIC price per TH**
Host AI for a tenant	**$3,899**	**$77,977**	$6.15M to $8.46M: $8M to $11M per MW of critical IT (TeraWulf, Cipher filings) divided by PUE	$123.08M to $169.23M	**4.3 to 5.9 years**
Own GPUs (H100)	**$26,056**	**$521,123**	$20.00M (CoinShares Q4 2025, in the model; source does not say per MW of IT or grid)	$400.00M	**2.1 years**

FINANCING THE AI PART, PER GRID MW MOVED TO AI

Answer for this site: each MW moved to AI needs about $1.76M of your cash before first rent and gives it back in 82 months (6.8 yr) from signing, on 10-year loan at 10%, only in the favorable case (low capex, 85% margin). On a 5-year loan the rent does not cover the payment. How many of the 20 MW go to AI is set by your cash: MW = your cash / $1.76M or more.

Loan term and rate	Your cash before first rent	DSCR, first year at full rent	Meets 1.15x?	Your cash back, from signing
10 years at 10%	$1.76M to $2.41M	**1.29x to 0.77x**	only favorable	82 months (6.8 yr) to 170 months (14.2 yr)
10 years at 15%	$1.95M to $2.68M	**1.04x to 0.62x**	no	112 months (9.3 yr) to 194 months (16.2 yr)

12 months of construction with no AI income, then 6 months of tenant ramp. Loan of 80% of capex with a 3-month reserve (USD.AI structure), rates of 10% and 15% (what USD.AI charged smaller operators, American Compute, Oct 2026). Ranges: low capex and 85% NOI margin to high capex and 70%. Mining for the last 8 months at this fleet and power price: 4 of 8 at or below zero.

One-page summary. The full study (fictional-site.pdf) has the month-by-month mining, the MW mix, every assumption and every source link. Model: github.com/Hoblayerta/mw-index. Generated 09 Nov 2026 15:28 CST.
